Conditional probability and Bayes Conditional probabilities Assigning probabilities by conditioning Independent events Law of conditional probability Baye's rule in odds forms Bayesian inference discrete case

- explain the frequency-based interpretation of probability.
- constructing the mathematical foundations of probability theory has proven to be a long-lasting process of trial an error.
- the approach of defining probability as relative frequencies of repeatable experiments lead to unsatisfactory theory (why?) https://www.jstor.org/stable/pdf/20115155.pdf
- the frequency view of probability has a long history that goes back to Aristotle.
- in 1933 the Russian mathematician Andrej Kolmogrov (1903-1987) laid a satisfactory mathematical foundation of probability theory.

He created a set of axioms. Axioms state a number of minimal requirements that the probability objects should satisfy. From these few algorithms all claims of probability can be derived, as we will see.

## Definition 1 (Probability model)

A **probability model** is a matematical representation of a random experiment.

## Probability model

Axiomatic definition of probability

### Definition 1 (Probability model)

A probability model is a maternatical representation of a random experiment. It consists of a description of all possible outcomes of the experiment (i.e., sample space), a set of subsets of the sample space (i.e., events), and an assignment of probability to events (i.e., probability measure).

## Definition 3 (Event)

An **event** is a subset of the sample space. We denote the collection of all events by  $\mathcal{F}$ .

#### Notes:

- We will only assign probabilities to events (i.e., to sets  $A \in \mathcal{F}$ ).
- ② For finite or countable sample spaces, we can assign probabilities to any subset of the sample space. Thus, any subset of a finite or countable sample space can be an event.
- $oldsymbol{\circ}$  For uncountable sample spaces, we can only assign probabilities to well behaved subsets of the sample space (i.e., to elements in a  $\sigma$  algebra of subsets of the sample space). Only well-behaved subsets of an uncountable sample space can be events.

#### Rule 1

For any finite number of mutually exclusive events  $A_1, \ldots, A_N$ ,

$$P(A_1 \cup A_2 \cup \ldots \cup A_n) = P(A_1) + \ldots + P(A_N)$$

#### Rule 2

For any event A,

$$P(A) = 1 - P(A^c)$$

where the event  $A^c$  consists of all outcomes that are not in A.

#### Rule 3

Let A, B be two events such that  $A \subseteq B$ . Then  $P(A) \leq P(B)$ .

#### Rule 4

For any two events A and B,

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

#### Proof.

Denote by  $\emptyset$  the empty set. We will firt prove that  $P(\emptyset) = 0$ . Take  $A_i = \emptyset$ for  $i = 1, 2, \ldots$  Then  $\emptyset = \bigcup_{i=1}^{\infty} A_i$ . Next, by Axiom 3,  $P(\emptyset) = \sum_{i=1}^{\infty} P(A_i) = \sum_{i=1}^{\infty} P(\emptyset)$ . This implies that  $P(\emptyset) = 0$ .

Define  $A_{N+i} = \emptyset$  for i = 1, 2, ... Then

$$P(A_1 \cup A_2 \cup ... \cup A_N) = P(A_1 \cup A_2 \cup ... \cup A_N \cup A_{N+1} \cup A_{N+2} \cup ...)$$

$$= P(\bigcup_{i=1}^{\infty} A_i) = \sum_{i=1}^{\infty} P(A_i)$$

$$= \sum_{i=1}^{N} P(A_i) + \sum_{j=1}^{\infty} P(A_{N+j}) = \sum_{i=1}^{N} P(A_i)$$

#### Notes:

- 1 the last equality in the second line holds by Axiom 1
- the last equality in the third line holds because  $P(A_{N+i}) = P(\emptyset) = 0$ .

## Proof of rule 2

Foundations of probability theory

Some basic rules

Condition probability and Bayes

Condition probabil

Assigning probabilities b conditioning

Law of conditional probability Baye's rule in odds form

Bayesian inference discrete case

Reference

### Proof.

 $\Omega = A \cup A^c$ . A and  $A^c$  are disjoint. Then, by Rule 1,

$$P(\Omega) = P(A) + P(A^c)$$
. From Axiom 2,  $P(\Omega) = 1$ . Thus,  $1 = P(A) + P(A^c)$ .

Foundations of probability theorv

Historical notes

Axiomatic definition of probability

Some basic rule

Conditional probability and Bayes

Conditional

Assigning

Independent ever

probability

Baye's rule in odds

Bayesian inference

Reference

#### Proof.

$$A \cup B = (A \setminus B) \cup (B \setminus A) \cup (A \cap B)$$
$$A = (A \setminus B) \cup (A \cap B)$$
$$B = (B \setminus A) \cup (A \cap B)$$

Since the sets in the right-hand-side of the above equations are pairwise disjoint, by rule 1, we obtain

$$P(A \cup B) = P(A \setminus B) + P(B \setminus A) + P(A \cap B)$$

$$P(A) = P(A \setminus B) + P(A \cap B) \to P(A \setminus B) = P(A) - P(A \cap B)$$

$$P(B) = P(B \setminus A) + P(A \cap B) \to P(B \setminus A) = P(B) - P(A \cap B)$$

Replazing the equations on the right of the second and third line in the equation on the first line the rule is proved.

$$P(A \cup B) = P(A) - P(A \cap B) + P(B) - P(A \cap B) + P(A \cap B)$$
  
=  $P(A) + P(B) - P(A \cap B)$

- The event B= "there is a match between the two teams from England or between the two teams from Germany" is the union of the events  $B_E=$  "there is a match between the two teams from England" and  $B_G=$  "there is a match between the two teams from Germany" (i.e.,  $B=B_E\cup B_G$ ).
- Since  $B_E$  and  $B_G$  are not disjoint, we should use Rule 3 to compute  $P(B_E \cup B_G)$  (i.e.,  $P(B_E \cup B_G) = P(B_E) + P(B_G) P(B_E \cap B_G)$ .

Some basic rules

- The event B="there is a match between the two teams from England or between the two teams from Germany" is the union of the events  $B_F$ ="there is a match between the two teams from England" and  $B_G$ ="there is a match between the two teams from Germany" (i.e.,  $B = B_E \cup B_G$ ).
- Since  $B_E$  and  $B_G$  are not disjoint, we should use Rule 3 to compute  $P(B_E \cup B_G)$  (i.e.,  $P(B_E \cup B_G) = P(B_E) + P(B_G) - P(B_E \cap B_G)$ .
- $P(B_F) = P(B_G)$ . Since the match  $\{E_1, E_2\}$  is in all quarterfinals in  $B_E$ , to calculate  $N(B_F)$  we need to computer the number of matches between six

teams of three countries, as done in part (a). This gives  $N(B_E) = \frac{\binom{6}{2}\binom{4}{2}}{21}$ .

Then 
$$P(B_E) = P(B_G) = \frac{\binom{6}{2}\binom{4}{2}}{\binom{8}{2}\binom{6}{2}\binom{4}{2}\binom{4}{2}} = 0.142857.$$

- Since  $B_E$  and  $B_G$  are not disjoint, we should use Rule 3 to compute  $P(B_E \cup B_G)$  (i.e.,  $P(B_E \cup B_G) = P(B_E) + P(B_G) P(B_E \cap B_G)$ .
- $P(B_E) = P(B_G)$ . Since the match  $\{E_1, E_2\}$  is in all quarterfinals in  $B_E$ , to calculate  $N(B_E)$  we need to computer the number of matches between six teams of three countries, as done in part (a). This gives  $N(B_E) = \frac{\binom{6}{2}\binom{4}{2}}{3!}$ . Then  $P(B_E) = P(B_G) = \frac{\binom{6}{2}\binom{4}{2}}{\binom{3}{2}\binom{4}{2}\binom{4}{2}}{\binom{3}{2}\binom{4}{2}\binom{4}{2}} = 0.142857$ .
- Since the match  $\{E_1, E_2\}$  and  $\{G_1, G_2\}$  are in all quarterfinals in  $B_E \cap B_G$ , as in part (a),  $N(B_E \cap B_G) = \frac{\binom{4}{2}}{2!}$ . Then  $P(B_E \cap B_G) = \frac{\binom{4}{2}}{\binom{8}{2}\binom{6}{2}\binom{4}{2}} = 0.028571.$

Some basic rules

- The event B="there is a match between the two teams from England or between the two teams from Germany" is the union of the events  $B_F$ ="there is a match between the two teams from England" and  $B_G$ ="there is a match between the two teams from Germany" (i.e.,  $B = B_F \cup B_G$ ).
- Since  $B_E$  and  $B_G$  are not disjoint, we should use Rule 3 to compute  $P(B_E \cup B_G)$  (i.e.,  $P(B_E \cup B_G) = P(B_E) + P(B_G) - P(B_E \cap B_G)$ .
- $P(B_E) = P(B_G)$ . Since the match  $\{E_1, E_2\}$  is in all quarterfinals in  $B_E$ , to calculate  $N(B_F)$  we need to computer the number of matches between six teams of three countries, as done in part (a). This gives  $N(B_E) = \frac{\binom{6}{2}\binom{4}{2}}{21}$ .

Then 
$$P(B_E) = P(B_G) = \frac{\binom{6}{2}\binom{4}{2}}{\binom{8}{2}\binom{6}{2}\binom{4}{2}} = 0.142857.$$

- Since the match  $\{E_1, E_2\}$  and  $\{G_1, G_2\}$  are in all quarterfinals in  $B_E \cap B_G$ , as in part (a),  $N(B_E \cap B_G) = \frac{\binom{4}{2}}{2!}$ . Then  $P(B_E \cap B_G) = \frac{\binom{4}{2}}{\binom{2}{3}\binom{6}{2}\binom{4}{2}} = 0.028571.$
- Thus  $P(B_E \cup B_G) = P(B_E) + P(B_G) P(B_E \cap B_G) =$  $2 \times 0.142857 - 0.028571 = 0.257143$

- add to the problem statement:
- in 1992, 4936 women were murdered in the US, of which roughly 1430 were murdered by their (ex)husbands or boyfriends
- 5% of the married women in the US have at some point been physically abused by their husbands.
- assume that a woman who has been murdered by some other than her husband had the same same chance of being abused by her husband as a randomly selected woman
- Alan Dershowitz admitted that a substantial percentage of the husbands who murder their wives, previous to the murder, also physically abuse their wives. Given this statement, we assume that the proability that a husband physically abused his wife, given that he killed her, is 50 percent.
